Practical Examples of Applied Mathematics Problems and Their Solutions

Let's explore some real-world problems and how they can be approached.

Example 1: Modeling Population Growth with Differential Equations

Problem: A biologist wants to model the growth of a bacterial population in a controlled environment. The growth rate depends on the current population size, and the population is expected to grow exponentially under ideal conditions. Solution Approach: - Use the exponential growth model: $$ \frac{dP}{dt} = rP $$ where: - $ P(t) $ is the population at time $ t $, - $ r $ is the growth rate. - Solve the differential equation: $$ P(t) = P_0 e^{rt} $$ where $ P_0 $ is the initial population. Application: By plugging in initial conditions and growth rates, the biologist can predict population size at future times, aiding in experiments and resource planning.

Example 2: Optimizing Production in Manufacturing

Problem: A factory produces two products, A and B. The profit per unit of A is \$40, and for B is \$50. The manufacturing process has constraints: - Material 1: up to 100 units available. - Material 2: up to 80 units available. - To produce one unit of A requires 2 units of Material 1 and 1 unit of Material 2. - To produce one unit of B requires 1 unit of Material 1 and 2 units of Material 2. Question: How many units of A and B should be produced to maximize profit? Solution Approach: - Define variables: $$ x = \text{units of A}, \quad y = \text{units of B} $$ - Set up the objective function: $$ Maximize Z = 40x + 50y $$ - Constraints: $$ 2x + y \leq 100 \quad (\text{Material 1}) $$ $$ x + 2y \leq 80 \quad (\text{Material 2}) $$ $$ x, y \geq 0 $$ - Use linear programming methods (graphical or simplex algorithm) to find the optimal solution. Result: By solving the LP problem, the factory can determine the optimal number of units for each product to maximize profit while respecting resource constraints.

Example 3: Data Analysis Using Regression

Problem: A researcher has data on advertising expenditure and sales revenue over 12 months. They want to understand how advertising impacts sales. | Month | Advertising (in \$100s) | Sales (in \$1000s) | |||| | 1 | 5 | 50 | | 2 | 6 | 55 | | ... | ... | ... | | 12 | 8 | 65 | Solution Approach: - Use linear regression to model sales as a function of advertising: $$ Sales = \beta_0 + \beta_1 \times Advertising + \varepsilon $$ - Fit the model using least squares estimation to find $ \beta_0 $ and $ \beta_1 $. - Interpret the coefficients to understand the impact of advertising on sales. Application: The model can predict future sales based on planned advertising budgets and help optimize marketing strategies.
