Design Workflow in Zemax OpticStudio

1. Defining System Requirements and Specifications

The first step in optical system design is establishing clear requirements, including:

1. Field of view
2. Resolution and image quality
3. Wavelength range
4. Physical constraints (size, weight)
5. Environmental conditions

These parameters guide the entire design process and influence the choice of optical components and layout strategies.

2. Initial Conceptual Design

Using Zemax's intuitive interface, designers can set up a basic optical layout by selecting lenses, mirrors, and other elements from a comprehensive catalog or custom definitions. Key steps include:

1. Placing the primary optical elements
2. Defining the optical path and aperture stops
3. Setting initial parameters like focal length, field of view, and aperture sizes

This stage aims to produce a functional baseline system that meets basic imaging or illumination needs.

3. Sequential Ray Tracing and Initial Optimization

Once the initial layout is established, sequential ray tracing is performed to analyze image quality metrics such as:

1. Spot size
2. Modulation transfer function (MTF)
3. Distortion
4. Field curvature

Optimization algorithms then iteratively refine parameters like lens curvatures, thicknesses, and spacing to improve these metrics. Zemax provides tools like:

1. Sequential Optimization
2. Merit Functions to define performance goals
3. Constraints to maintain manufacturability

4. Advanced Analysis and Validation

After achieving satisfactory image quality, designers conduct comprehensive analyses, including:

1. Chromatic aberration analysis across the wavelength range
2. Field performance and off-axis aberrations
3. Stray light and ghost image analysis
4. Tolerance studies to assess sensitivity to manufacturing errors

Physical optics propagation may be employed to evaluate diffraction effects in high-precision systems.

5. Mechanical and Manufacturing Considerations

Integrating mechanical constraints ensures the design is feasible for manufacturing. Zemax supports:

1. CAD import/export for mechanical integration
2. Specification of tolerances and assembly variations
3. Generation of fabrication and assembly documentation

6. Prototype Simulation and Final Optimization

Simulating real-world manufacturing tolerances allows designers to optimize for robustness. Final adjustments are made to balance performance with manufacturability, cost, and assembly complexity.
