Sample Living Environment Regents Questions and Detailed

Answers

To truly prepare, students should practice with real questions, understanding both the correct responses and the reasoning behind them. Here are sample questions representative of the exam's style, followed by comprehensive explanations. Question 1: Multiple Choice Which of the following best describes the function of the mitochondria in a cell? A) Protein synthesis B) Energy production C) Genetic information storage D) Waste removal Answer: B) Energy production Explanation: Mitochondria are often called the "powerhouses" of the cell because they generate ATP, the energy currency used by cells. They are essential for cellular respiration, where glucose and oxygen are converted into energy. Question 2: Short Answer Describe how a mutation in the DNA sequence can affect the protein produced. Answer: A mutation in the DNA sequence can lead to a change in the mRNA codon during transcription. This change may result in the incorporation of a different amino acid into the protein during translation, potentially altering the protein's structure and function. In some cases, mutations can create a nonfunctional protein or cause it to be degraded, which can affect the organism's traits or health. Deep Dive: For example, a point mutation that substitutes one base in the DNA sequence might change a codon from coding for an amino acid to a stop signal, leading to a truncated, nonfunctional protein. Conversely, some mutations are silent and do not affect the amino acid sequence due to the redundancy of the genetic code. Question 3: Data Interpretation A diagram shows a food chain: grass → grasshopper → frog → snake. When a pesticide is sprayed on the grass, it affects the grasshopper and the frog more than the snake. Explain why. Answer: The pesticide is directly applied to the grass, which is the first organism in the chain. The grasshopper, which eats the grass, absorbs the pesticide, and thus its population is directly affected. The frog, which eats the grasshopper, accumulates the pesticide through its diet, leading to a higher concentration—this process is known as bioaccumulation. The snake eats the frog, but because the pesticide concentration decreases at each level due to metabolic breakdown and excretion, the snake is less affected than the grasshopper and frog. This illustrates how pesticides can have amplified effects on organisms lower in the food chain. Question 4: Extended Response Design an experiment to test whether sunlight affects the rate of photosynthesis in pondweed. Include your hypothesis, procedure, variables, and how you would analyze the results. Answer: Hypothesis: Increased sunlight intensity increases the rate of photosynthesis in pondweed. Procedure: 1. Obtain several identical samples of pondweed and place each in a test tube with a fixed amount of water containing sodium bicarbonate (as a carbon source). 2. Illuminate each sample with different intensities of light (e.g., low, medium, high) using a lamp with adjustable brightness. 3. Keep all other conditions constant: temperature, water volume, and type of pondweed. 4. Measure the rate of photosynthesis by observing the amount of oxygen produced, which can be detected by the size of bubbles produced over a set time period. 5. Record the data for each light intensity. Variables: - Independent Variable: Light intensity - Dependent Variable: Rate of photosynthesis (oxygen bubble production) - Controlled Variables: Temperature, water composition, pondweed species, duration of exposure Analysis: Plot the rate of oxygen production against light intensity. If the hypothesis is correct, the graph should show an increase in the rate of photosynthesis with increasing light, up to a certain point where it levels off.
